## Initial display :

Home page display :

On this page, you have 3 navigation buttons:

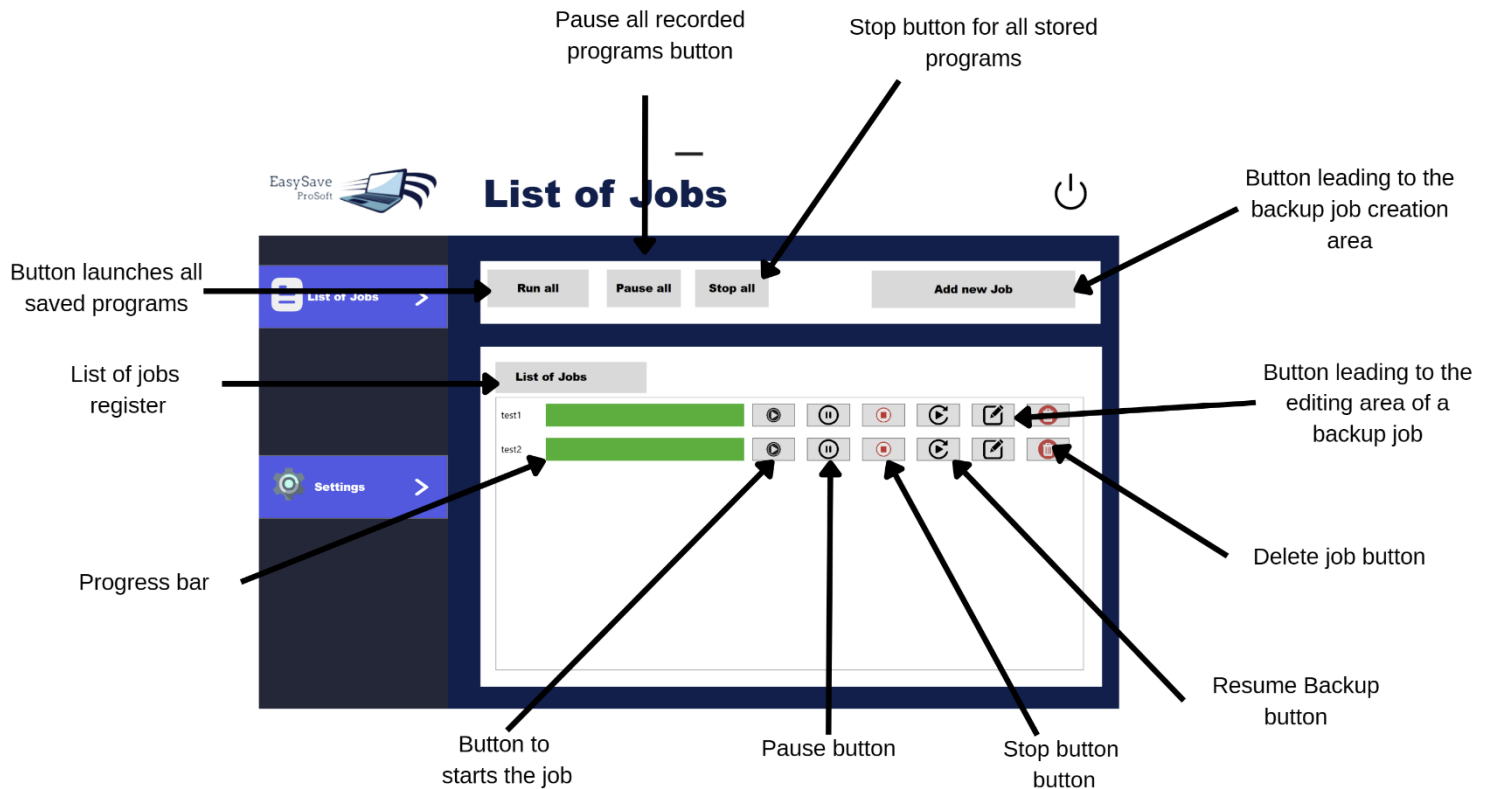

Settings, job list and finally the home page.

On the home page, there are two buttons, one for the user manual and the second for the release notes..

## Job list display

In this section, we have the job list and an interactive display showing the list of jobs. In this interface, you can launch all the jobs stored in the software. On the other button, you can add a job.

Moving on to the table, this gives you the option of launching jobs one by one. You can also edit the job you want, or delete it.

For each job we have a progress bar, which is displayed when the program starts the job.

## Adding a job

In this interface, we have 3 TextBoxes, the first for the job name.

The other two correspond to the source folder, i.e. the one that will be copied later. To select the source and target folders, you can click on the "Select a folder" button, which will open your "file browser".

### Add a Job

A screenshot of the 'Add a Job' interface. On the left is a dark blue sidebar with two menu items: 'List of Jobs' with a list icon and 'Settings' with a gear icon. The main area is light gray and contains the following fields: 'Name of the job' with a text input box; 'Source directory :' with a text input box and a 'Select a folder' button; 'Target directory :' with a text input box and a 'Select a folder' button; and 'Type of save :' with a dropdown menu showing 'Complete' and 'Differential' options. Four arrows point to these elements with labels: 'TextBox for job name' points to the 'Name of the job' input; 'Opening the folder browser' points to the 'Select a folder' button under 'Target directory'; 'Backup type' points to the 'Type of save' dropdown; and 'Add backup button' points to the 'Differential' option in the dropdown.

TextBox for job name

Opening the folder browser

Backup type

Add backup button

This will make it easier for you to fill in the information.

Next, you'll be presented with a drop-down menu for choosing the save mode (Complete or Differential).

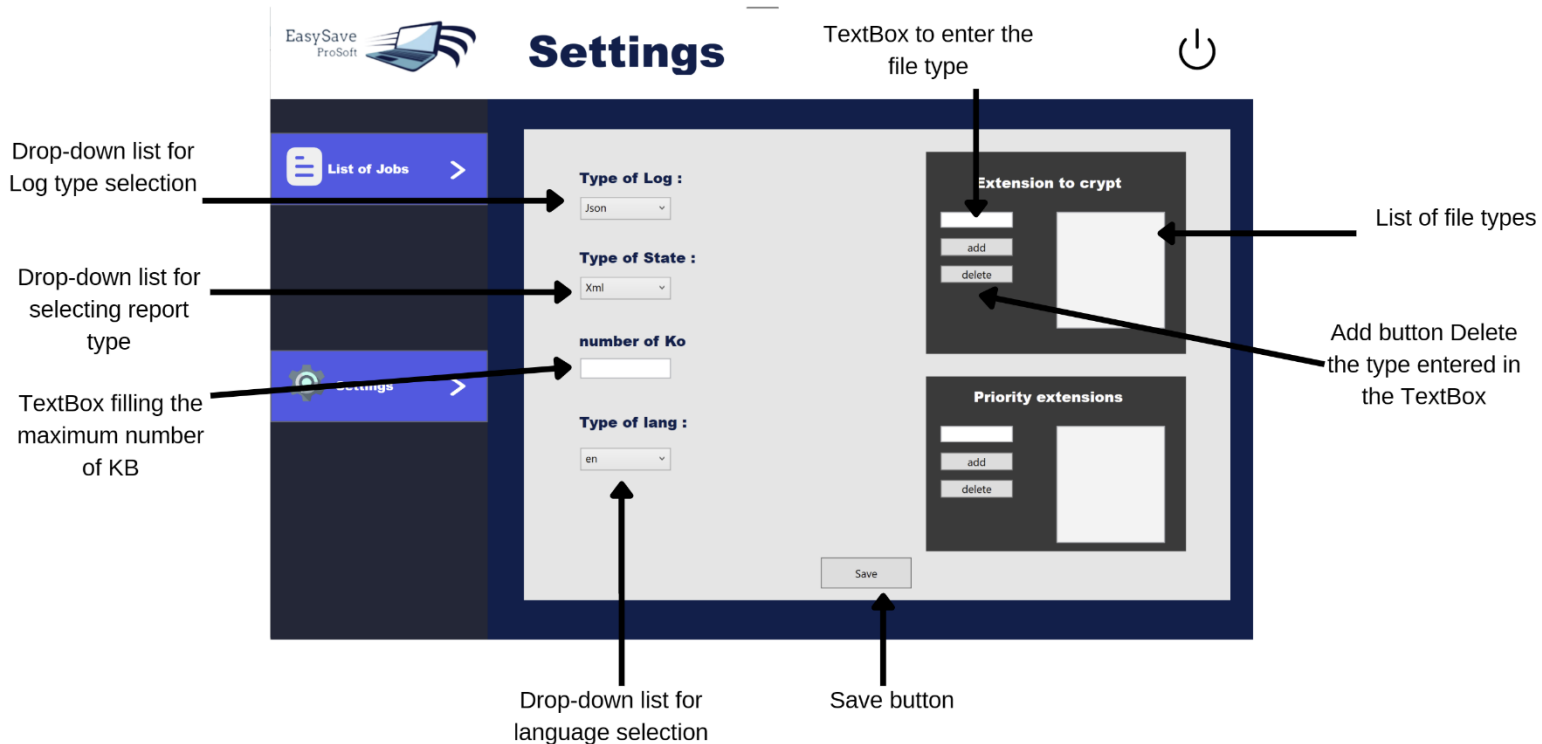

After that, the program will take you back to the Job List page.

## Job modification

This corresponds to the same interface as adding a job.

# Parameter

Here's the parameters interface, the display is divided into two parts, the first corresponding to the parameter for saving files, as you can see. There are two drop-down lists with a JSON or XML parameter for logs and reports. In the same column, we have the language modification.

For the second part of the display, you have a TextBox for entering the file types you wish to encrypt. Once you've filled in the TextBox, press the Add button and it will be displayed in the file type list. To delete a type, follow the same procedure, fill in the type you wish to delete and press the Delete button.

The same applies to priority extensions.

To save all the information entered in the column, press the Save button.

# Customer console

In this section, we've made sure that our client program has a similar interface. As you can see, you'll find the execution options in this section. There's also a button to attempt reconnection to the server. There's also a progress bar to show the program's current status.
